KEY ACADEMIC PROJECTS During Ph.D.

- Estimation Techniques for Doppler Spread in OFDM Systems

Course: Wireless Communication Networks

Abstract:Due to frequency offset the orthogonality between subcarriers is lost which induces Inter Carrier Interference (ICI) and performance of the system degrades greatly. In high Speed Mobile Communication, due to the time varying characteristic of the channel the Doppler spread and Doppler shift are induced. Ability of countering Doppler Effect has important theoretical significance. This paper focuses on various estimation techniques for estimating Doppler frequency.

- ℓ -1 Norm Minimization Methods

Course: Convex Optimization in SPCOM

Abstract:For sparse signal recovery constrained ℓ -1 norm minimization is the most oftenly used method. In many cases, the signal sparsity and the recovery performance can be further improved by replacing the ℓ -1 norm with a "weighted" ℓ -1 norm. In this paper different methods for ℓ -1 norm minimization such as Trend filtering, HP filtering, Quadratic Program, Least Square problems (LSP) have been studied along with illustrative examples.
