# FACTORIAL EXPERIMENTS

Dr. Shalabh

Department of Mathematics and Statistics  
Indian Institute of Technology Kanpur

Factorial experiments involve simultaneously more than one factor each at two or more levels.

Several factors affect simultaneously the characteristic under study in factorial experiments and the experimenter is interested in the main effects and the interaction effects among different factors.

First we consider an example to understand the utility of factorial experiments.

**Example:** Suppose the yield from different plots in an agricultural experiment depend upon

1. (i) variety of crop and (ii) type of fertilizer.

Both the factors are in the control of experimenter.

2. (iii) Soil fertility. This factor is not in the control of experimenter.

In order to compare the different crop varieties

- assign it to different plots keeping other factors like irrigation, fertilizer, etc. fixed and the same for all the plots.
- The conclusions for this will be valid only for the crops grown under similar conditions with respect to the factors like fertilizer, irrigation etc.

In order to compare different fertilizers (or different dosage of fertilizers)

- sow single crop on all the plots and vary the quantity of fertilizer from plot to plot.
- The conclusions will become invalid if different varieties of crop are sown.
- It is quite possible that one variety may respond differently than another to a particular type of fertilizer.

Through the factorial experiments, we can study the individual effect of each factor and interaction effect.

Now we consider a  $2^2$  factorial experiment with an example and try to develop and understand the theory and notations through this example.

Factors

Levels

A general notation for representing the factors is to use capital letters, e.g., *A, B, C* etc.

and

levels of a factor are represented in small letters.

For example, if there are two levels of  $A$ , they are denoted as  $a_0$  and  $a_1$ .

Similarly the two levels of  $B$  are represented as  $b_0$  and  $b_1$ .

Other alternative representation to indicate the two levels of  $A$  is 0 (for  $a_0$ ) and 1 (for  $a_1$ ).

The factors of  $B$  are then 0 (for  $b_0$ ) and 1 (for  $b_1$ ).

$(ab)$ : Mean of all observations which receive the treatment combinations  $ab$ .

**Note:** An important point to remember is that the factorial experiments are conducted in a design of experiment. For example, the factorial experiment is conducted as an RBD.

Example:

Two factors: Irrigation (I) and Nitrogen (N).

Levels:

Irrigation has 2 levels:  $I_0$  and  $I_1$

Nitrogen has 3 levels:  $N_0$ ,  $N_1$  and  $N_2$

We need two RBD

$N_0$	$N_1$	$N_2$
$N_2$	$N_0$	$N_1$
$N_1$	$N_2$	$N_0$

$N_0$	$N_1$	$N_2$
$N_2$	$N_0$	$N_1$
$N_1$	$N_2$	$N_0$

$I_0N_0$	$I_0N_1$	$I_0N_2$
$I_0N_2$	$I_0N_0$	$I_0N_1$
$I_0N_1$	$I_0N_2$	$I_0N_0$

$I_1N_0$	$I_1N_1$	$I_1N_2$
$I_1N_2$	$I_1N_0$	$I_1N_1$
$I_1N_1$	$I_1N_2$	$I_1N_0$

Total number of plots required : 18

$I_0N_0$	$I_0N_1$	$I_0N_2$
$I_0N_2$	$I_0N_0$	$I_0N_1$
$I_0N_1$	$I_0N_2$	$I_0N_0$

Difference among N levels

Difference among I levels

$I_1N_0$	$I_1N_1$	$I_1N_2$
$I_1N_2$	$I_1N_0$	$I_1N_1$
$I_1N_1$	$I_1N_2$	$I_1N_0$

Difference among N levels
