Lecture 33

Association of Variables : Univariate and Bivariate Scatter Plots

Shalabh

Department of Mathematics and Statistics Indian Institute of Technology Kanpur

Slides can be downloaded from http://home.iitk.ac.in/~shalab/sp

Association of Two Variables Example

- Number of hours of study affect the marks obtained in an examination.
- Electricity/power consumption increases when the weather temperature increases.
- Weight of infants and small children increases as their height increases under normal circumstances.

Association of Two Variables

The observations on both the variables are related to each other.

How to know the variables are related?

How to know the degree of relationship between the two variables?

Graphical procedures – Two dimensional plots, three dimensional plots etc.

Quantitative procedures – Correlation coefficients, contingency tables, Chi-square statistic, linear regression, nonlinear regression etc.

Association of Two Variables

How to judge or graphically summarize the association of two variables?

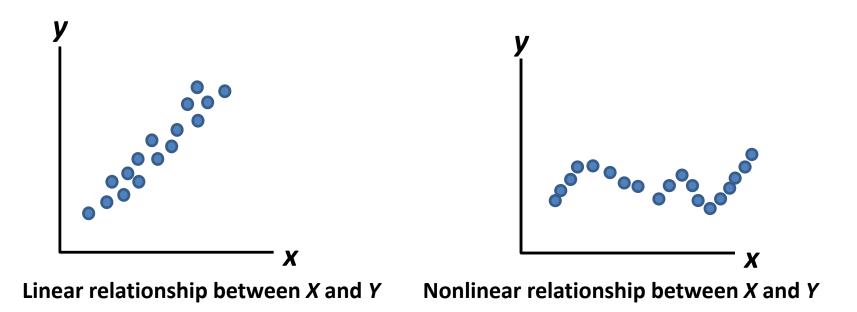

X, Y: Two variables

n pairs of observations are available as (x_1,y_1) , (x_2,y_2) ,..., (x_n,y_n)

Plot the paired observations in a single graph, called as scatter plot.

Scatter plot reveals the nature and trend of possible relationship.

Relationships: Linear or nonlinear.

5

Strength and Trend of Relationships

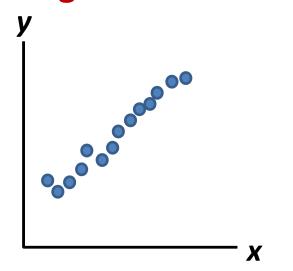

Fig. 1: Strong positive linear relationship

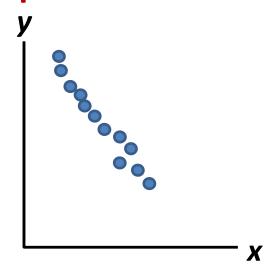

Fig. 2: Strong negative linear relationship

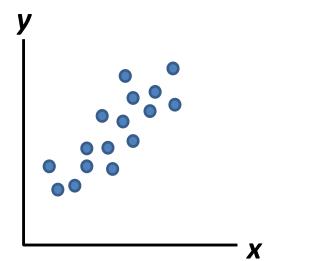

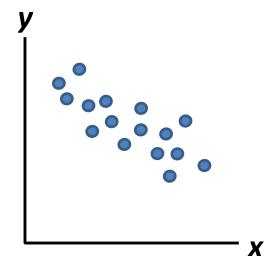

Fig. 3: Moderate positive linear relationship Fig. 4: Moderate negative linear relationship

Strength and Trend of Relationships

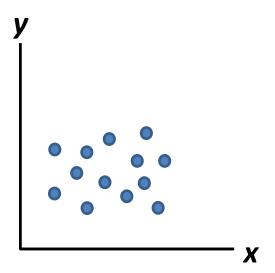

Fig. 5: No clear relationship

We will study about the direction and degree of linear relationships.

Two aspects – graphical and quantitative

Plot command for one variable:

x: Data vector

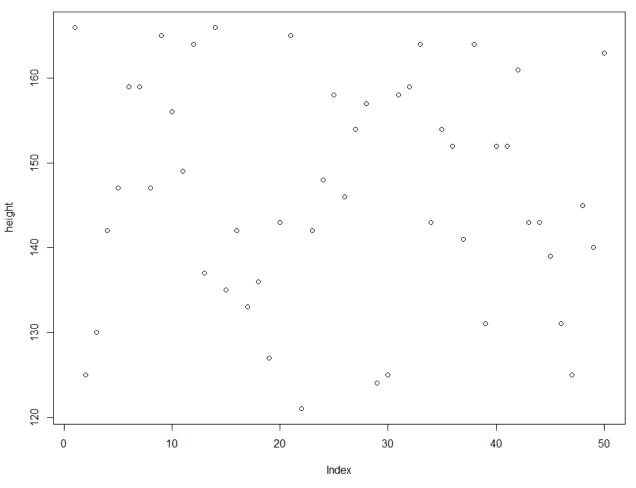

plot(x)

Example

Height of 50 persons are recorded (in Centimetres) as follows: 166,125,130,142,147,159,159,147,165,156,149,164,137,166,135,142, 133,136,127,143,165,121,142,148,158,146,154,157,124,125,158,159, 164,143,154,152,141,164,131,152,152,161,143,143,139,131,125,145, 140,163

```
> height = c(166,125,130,142,147,159,159,147,
165,156,149,164,137,166,135,142,133,136,127,143,
165,121,142,148,158,146,154,157,124,125,158,159,
164,143,154,152,141,164,131,152,152,161,143,143,
139,131,125,145,140,163)
```

plot(height)

Bivariate plots

Provide first hand visual information about the nature and degree of relationship between two variables.

Relationship can be linear or nonlinear.

We discuss several types of plots through examples.

Plot command:

```
x, y: Two data vectors
plot(x, y)
plot(x, y, type)
```

type						
"p" for p oints	"1" for lines					
"b" for b oth	"c" for the lines part alone of "b"					
"o" for both 'overplotted'	"s" for stair steps.					
"h" for 'histogram' like (or 'high-density') vertical lines						

Plot command

```
x, y: Two data vectors
plot(x, y)
plot(x, y, type)
Get more details from help: help("type")
Other options:
main
             an overall title for the plot.
              sub title for the plot.
suba
             title for the x axis.
xlaba
ylaba
              title for the y axis.
             y/x aspect ratio.
aspthe
```

Data on marks obtained by 20 students out of 500 marks and the number of hours they studied per week are recorded as follows:

We know from experience that marks obtained by students increase as the number of hours increase.

Marks	337	316	327	340	374	330	352	353	370	380
Number of hours per week	23	25	26	27	30	26	29	32	33	34

Marks	384	398	413	428	430	438	439	479	460	450
Number of hours per week	35	38	39	42	43	44	45	46	44	41

Example

```
marks =
c(337,316,327,340,374,330,352,353,370,380,384,39
8,413,428,430,438,439,479,460,450)
hours =
c(23,25,26,27,30,26,29,32,33,34,35,38,39,42,43,44,45,46,44,41)
```

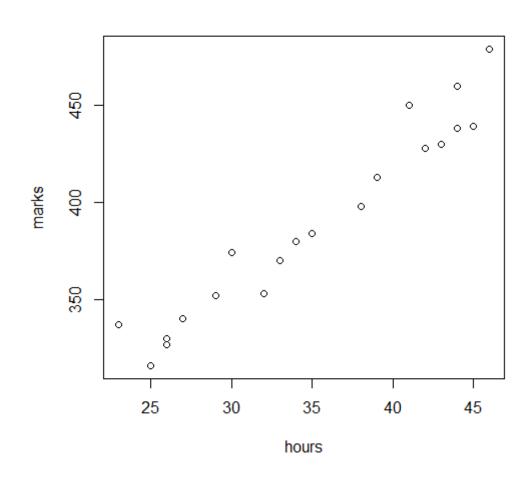

plot command:

x, y: Two data vectors

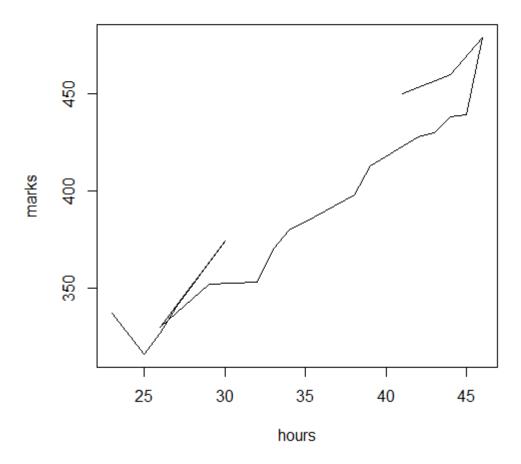

Various type of plots are possible to draw.

plot(x, y)

plot(hours, marks)

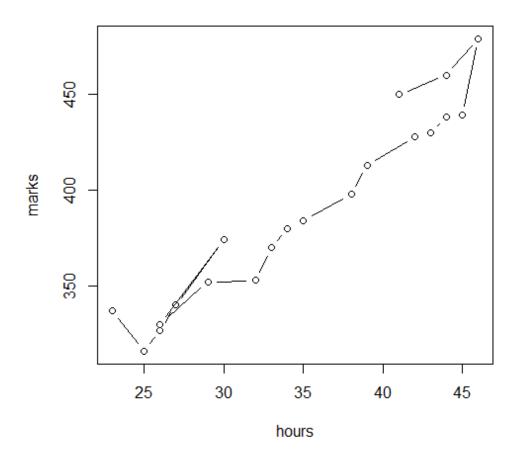

```
plot(hours, marks, "1")
"1" for lines,
```

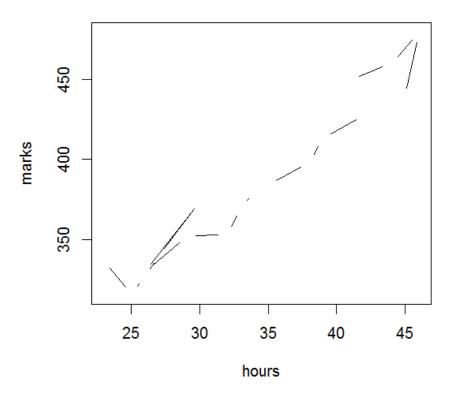

```
plot(hours, marks, "b")
```

"b" for both – line and point

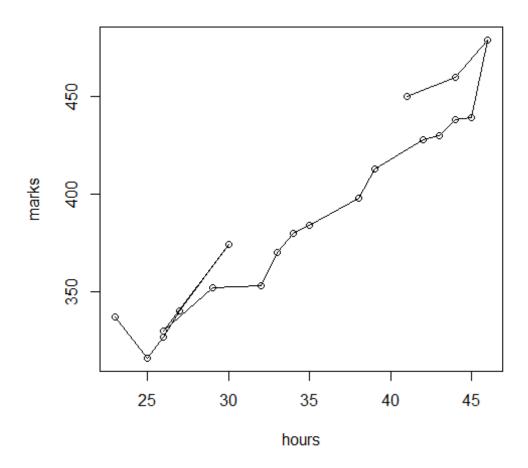

```
plot(hours, marks, "c")
"c" lines part alone of "b"
```

plot(hours, marks, "o")

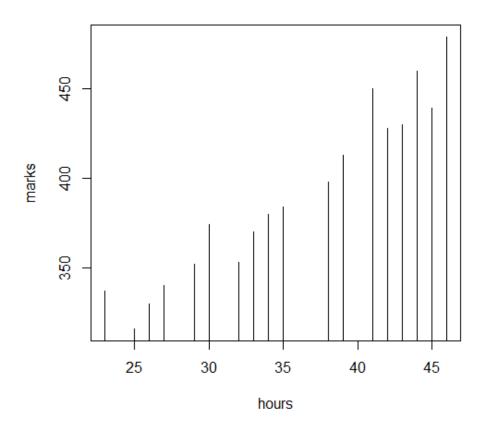

"o" for both 'overplotted'

Example

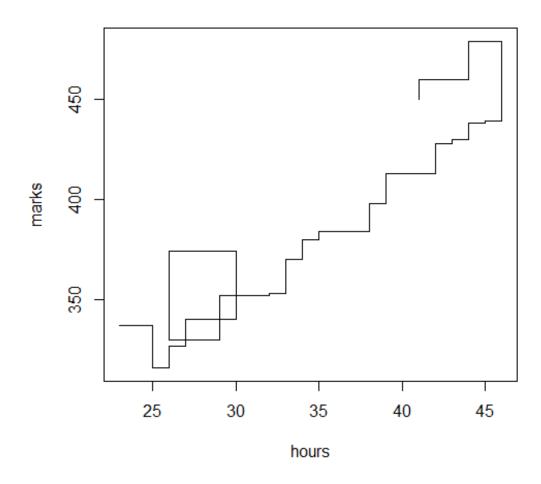

```
plot(hours, marks, "h")
```

"h" for 'histogram' like (or 'high-density') vertical lines

```
plot(hours, marks, "s")
```

"s" for stair steps.

plot(hours, marks, xlab="Number of weekly
hours", ylab="Marks obtained", main="Marks
obtained versus Number of hours per week")

Marks obtained versus Number of hours per week
