Practice Problems 16: Integration, Riemann's Criterion for integrability (Part II)

- 1. Let $f:[a,b]\to\mathbb{R}$ be integrable and $[c,d]\subset[a,b]$. Show that f is integrable on [c,d].
- 2. (a) Let f be bounded on [c, d], $M = \sup\{f(x) : x \in [c, d]\}$, $M' = \sup\{|f(x)| : x \in [c, d]\}$, $m = \inf\{f(x) : x \in [c,d]\}\$ and $m' = \inf\{|f(x)| : x \in [c,d]\}.$ Show that $M' - m' \le$
 - (b) Let $f:[a,b]\to\mathbb{R}$ be integrable. Show that |f| and f^2 are integrable.
- 3. (a) Find $f:[0,1]\to\mathbb{R}$ such that |f| is integrable but f is not integrable.
 - (b) Find $f:[0,1]\to\mathbb{R}$ such that f^2 is integrable but f is not integrable.
- 4. Let f and g be two integrable functions on [a, b].
 - (a) If $f(x) \leq g(x)$ for all $x \in [a, b]$, show that $\int_a^b f(x) dx \leq \int_a^b g(x) dx$.
 - (b) Show that $\left| \int_a^b f(x) dx \right| \le \int_a^b |f(x)| dx$.
 - (c) If $m \leq f(x) \leq M$ for all $x \in [a,b]$ show that $m(b-a) \leq \int_a^b f(x) dx \leq M(b-a)$. Use this inequality to show that $\frac{\sqrt{3}}{8} \leq \int_{\pi/4}^{\pi/3} \frac{\sin x}{x} dx \leq \frac{\sqrt{2}}{6}$.
- 5. Let $f:[a,b]\to\mathbb{R}$ and $f(x)\geq 0$ for all $x\in[a,b]$
 - (a) If f is integrable, show that $\int_a^b f(x)dx \ge 0$.
 - (b) If f continuous and $\int_a^b f(x)dx = 0$ show that f(x) = 0 for all $x \in [a, b]$.
 - (c) Give an example of an integrable function f on [a,b] such that $f(x) \geq 0$ for all $x \in [a,b]$ and $\int_a^b f(x)dx = 0$ but $f(x_0) \neq 0$ for some $x_0 \in [a,b]$.
- 6. Let $f:[0,1]\to\mathbb{R}$ be a bounded function. Suppose that for any $c\in(0,1]$, f is integrable on [c, 1].
 - (a) Show that f is integrable on [0,1].
 - (b) Show that the function f defined by f(0) = 0 and $f(x) = \sin(\frac{1}{x})$ on (0,1] is integrable,
- 7. Let $f:[a,b]\to\mathbb{R}$ be a continuous function. Suppose that whenever the product fg is integrable on [a,b] for some integrable function g, we have $\int_a^b (fg)(x)dx = 0$. Show that f(x) = 0 for every $x \in [a, b]$.
- 8. (a) Let $x, y \ge 0$. Show that $\lim_{n\to\infty} (x^n + y^n)^{\frac{1}{n}} = M$ where $M = \max\{x, y\}$.
 - (b) Let $f:[a,b]\to\mathbb{R}$ be continuous and $f(x)\geq 0$ for all $x\in[a,b]$. Show that $\lim_{n\to\infty} \left(\int_a^b f(x)^n \right)^{\frac{1}{n}} = M$ where $M = \sup\{f(x) : x \in [a,b]\}.$
- (a) (Cauchy-Schwarz inequality) Let $x_1, x_2, ... x_n, y_1, y_2, ..., y_n \in \mathbb{R}$. By observing that
 - $\sum_{i=1}^{n} (tx_i + y_i)^2 \ge 0 \text{ for any } t \in \mathbb{R}, \text{ show that } |\sum_{i=1}^{n} x_i y_i| \le \left(\sum_{i=1}^{n} x_i^2\right)^{\frac{1}{2}} \left(\sum_{i=1}^{n} y_i^2\right)^{\frac{1}{2}}.$ (b) (Cauchy-Schwarz inequality) Let f and g be any two integrable functions on [a, b]. Show that $\left(\int_a^b f(x)g(x)dx\right)^2 \le \left(\int_a^b |f(x)|^2 dx\right) \left(\int_a^b |g(x)|^2 dx\right).$
- 10. (*) Let $f:[a,b]\to\mathbb{R}$ be integrable. Suppose that the values of f are changed at a finite number of points. Show that the modified function is integrable.
- 11. (*) Let f:[a,b] be a bounded function and $E\subset[a,b]$. Suppose that E can be covered by a finite number of closed intervals whose total length can be made as small as desired. If f is continuous at every point outside E, show that f is integrable.

Practice Problems 16: Hints/Solutions

- 1. Let $\epsilon > 0$. Since f is integrable on [a,b], there exists a partition $P = \{x_0, x_1, x_2, ..., x_n\}$ (of [a,b]) such that $U(P,f) L(P,f) < \epsilon$. Let $P_1 = P \cup \{c,d\}$ and $P' = P_1 \cap [c,d]$ which is a partition of [c,d]. Then, since $M_i m_i > 0$, it follows that $U(P',f) L(P',f) \le U(P_1,f) L(P_1,f) \le U(P,f) L(P,f) < \epsilon$. Apply the Riemann Criterion.
- 2. (a) Let $x, y \in [c, d]$. Then $|f(x)| |f(y)| \le |f(x) f(y)| \le M m$. Fix y and take supremum for x, we get $M' |f(y)| \le M m$. Take infimum for y.
 - (b) To show that |f| is integrable, use the Riemann Criterion and (a). For showing f^2 is integrable, use the inequality $(f(x))^2 - (f(y))^2 \le 2K|f(x) - f(y)|$ where $K = \sup\{|f(x)| : x \in [a,b]\}$ and proceed as in (a).
- 3. Let $f:[0,1] \to \mathbb{R}$ be defined by f(x) = -1 for x rational and f(x) = 1 for x irrational. Then $|f| = f^2$. Note that f is not integrable but |f| is a constant function.
- 4. (a) Use $\int_a^b g(x)dx \int_a^b f(x)dx = \int_a^b (g-f)(x)dx$ and Problem 3 of Practice Problems 15
 - (b) Since $-|f(x)| \le f(x) \le |f(x)|$, $x \in [a, b]$, (b) follows from part (a).
 - (c) Use part (a) or $L(P,f) \leq \int_a^b f(x) dx \leq U(P,f)$. On $\left[\frac{\pi}{4}, \frac{\pi}{3}\right]$, $\frac{\sin x}{x}$ decreases.
- 5. (a) This follows from the definition of integrability of f or from Problem 4.
 - (b) Let $x_0 \in (a, b)$ be such that $f(x_0) > \alpha$ for some $\alpha > 0$. Then by the continuity of f there exists a $\delta > 0$ such that $(x_0 \delta, x_0 + \delta) \subseteq (a, b)$ and $f(x) > \alpha$ on $(x_0 \delta, x_0 + \delta)$. Then we can find a partition P of [a, b] such that $\int_a^b f(x) dx \ge L(P, f) > \alpha \times \delta > 0$.
 - (c) Let f(a) = 1 and f(x) = 0 for all $x \in (a, b]$. Then $\int_a^b f(x) dx = 0$ but $f(a) \neq 0$.
- 6. (a) Let $M = \sup\{|f(x)| : x \in [0,1]\}$. If $P_n = \{\frac{1}{n}, x_1, x_2, ..., x_n\}$ is a partition of $[\frac{1}{n}, 1]$ then let $P'_n = \{0, \frac{1}{n}, x_1, x_2, ..., x_n\}$ be a corresponding partition of [0, 1]. Then $U(P'_n, f) \leq \frac{M}{n} + U(P_n, f)$ and $L(P'_n, f) \geq -\frac{M}{n} + L(P_n, f)$. Therefore, $U(P'_n, f) L(P'_n, f) \leq \frac{2M}{n} + U(P_n, f) L(P_n, f)$. For $\epsilon > 0$, first choose n such that $\frac{2M}{n} < \frac{\epsilon}{2}$ and then choose P_n such that $U(P_n, f) L(P_n, f) < \frac{\epsilon}{2}$. Apply the Riemann Criterion.
 - (b) Since f is continuous on [c, 1] for every c satisfying 0 < c < 1, f is integrable on [c, 1]. Apply part (a).
- 7. Suppose $f(x_0) > 0$ for some $x_0 \in (a, b)$. Use the argument used in Problem 5(b).
- 8. (a) Note that $M \leq (x^n + y^n)^{\frac{1}{n}} \leq (2M^n)^{\frac{1}{n}}$. Use the Sandwich Theorem.
 - (b) For $\epsilon > 0$, by the continuity of f, $\exists [c,d] \subseteq [a,b]$ such that $f(x) > M \epsilon \ \forall \ x \in [c,d]$. Hence $(M-\epsilon)(d-c)^{\frac{1}{n}} \le \left(\int_a^b f(x)^n\right)^{\frac{1}{n}} \le M(b-a)^{\frac{1}{n}}$. Note that $M(b-a)^{\frac{1}{n}} \to M$ and $(M-\epsilon)(d-c)^{\frac{1}{n}} \to M \epsilon$. Hence there exists $N \in \mathbb{N}$ such that for all $n \ge N$, $M-2\epsilon \le (M-\epsilon)(d-c)^{\frac{1}{n}} \le \left(\int_a^b f(x)^n\right)^{\frac{1}{n}} \le M(b-a)^{\frac{1}{n}} \le M + \epsilon$..
- 9. We will see the solution of part (b) and the solution of part (a) is similar. Note that the inequality $\int_a^b (tf(x)-g(x))^2 = t^2 \left(\int_a^b f^2(x)dx\right) 2t \left(\int_a^b f(x)g(x)dx\right) + \left(\int_a^b g^2(x)dx\right) \geq 0$ holds for all $t \in \mathbb{R}$. Take $t = \frac{\alpha}{\beta}$ where $\alpha = \int_a^b f(x)g(x)dx$ and $\beta = \int_a^b f^2(x)dx$.
- 10. Suppose the values of f are changed at $c_1, c_2, ..., c_p$ and g is the modified function. Let $M = \max\{|g(c_1)|, |g(c_2)|, ..., |g(c_p)|\}$. Let $\epsilon > 0$. Since f is integrable, there exists a partition P of [a, b] such that $U(P, f) L(P, f) < \frac{\epsilon}{2}$. Cover $c_i's$ by the intervals

 $[y_1, y_2], [y_3, y_4], ..., [y_{2p-1}, y_{2p}]$ where $y_i's$ are in [a, b] and $|y_1 - y_2| + |y_3 - y_4| + ... + |y_{2p-1} - y_{2p}| < \frac{\epsilon}{4pM}$. Consider the partition $P_1 = P \cup \{y_1, y_2, ..., y_{2p}\}$. Then $U(P_1, g) - L(P_1, g) \le U(P_1, f) - L(P_1, f) + \frac{2pM\epsilon}{4pM} < U(P, f) - L(P, f) + \frac{\epsilon}{2} \le \epsilon$. Apply the Riemann Criterion.

11. Proceed as in Theorem 4 and Problem 10.
